

RPH Fans

FAN USE

Fully controlled, low-pressure RPH sound-insulated radial fans intended for the square duct can be universally used for complex air-conditioning, from simple venting installations to sophisticated air-handling systems. By noise insulation is meant the reduction of the acoustic output level in the direction of "the surroundings". In order to reduce the acoustic output level in the direction of "intake" and "exhaust", it is necessary to supplement the fan with noise-insulated attenuators. Ideally, they can be used along with other components of the Vento modular system which ensure inter-compatibility and balanced parameters.

OPERATING CONDITIONS, POSITION

These fans are designed for indoor applications. Outdoor applications are possible providing sufficient roofing is ensured. They are designed to transport air without solid, fibrous, sticky, aggressive, respectively explosive impurities. For outdoor applications it is necessary to finish the fans with a protective coating (except rating plates). The transported air must be free of corrosive chemicals or chemicals aggressive to zinc and/or aluminium. Acceptable temperature of transported air can range from -30 °C to +40 °C, and with certain types up to +70 °C. The maximum nominal values for each fan are included in table 4. The RPH fans can work in any position. When positioned under the ceiling, it is advisable to situate the fan with the motor cup directed downwards to easy access to the motor terminal box. However, if the transported air is oversaturated with moisture or if the risk of intensive steam condensation inside the fan exists, it is better to situate the fan's cup upwards. We recommend adding a 1–1.5 m long piece of straight duct to the fan's outlet to reduce pressure losses in an assembly.

DIMENSIONAL RANGE

RPH fans are manufactured in a range of nine sizes according to the A × B dimensions of the connecting flange. Several fans differing in the number of motor poles are available for each size. When planning the fan for the required air flow and pressure, the following general rule is applied; the larger fans with higher number of poles reach the required parameters at lower RPM, which results in lower noise and longer service life. Fans with higher number of poles also have lower air velocity in the cross section, which results in lower pressure losses in the duct and accessories, however, at higher investment costs. The standard dimensional and per-

FIG. 1 – DIMENSIONS

| A × B [mm] | |
|------------|--------|
| 400-200 | 40-20 |
| 500-250 | 50-25 |
| 500-300 | 50-30 |
| 600-300 | 60-30 |
| 600-350 | 60-35 |
| 700-400 | 70-40 |
| 800-500 | 80-50 |
| 900-500 | 90-50 |
| 1000-500 | 100-50 |

formance range of single-phase and three-phase RPH fans enables the designers to optimize all parameters for air flow up to 11,700 m³ per hour.

MATERIALS

The external casing and connecting flanges of RPH fans are made of galvanized steel sheets (Zn 275 g/m²). Impeller blades – with forward curved blades (all fan types excluding 100-50/56-4D) are made of galvanized steel sheets, 100-50/56-4D has impeller blades with backward curved blades and it is made of painted steel. Diffusers are made of aluminum, motors are made of aluminum alloys, copper and plastic. The noise insulation is made of non-combustible, rot-resistant, waterproof mineral wool.

MOTORS

Compact single-phase and three-phase asynchronous motors with an external rotor and a resistance armature are used as drives. The motors are situated inside the impeller, and during operation are optimally cooled by the flowing air. The motor's high quality enclosed ball bearings with permanent lubricating filling enable the fans to reach a service life above 40,000 operating hours without maintenance. The motor electric protection degree is mostly IP 54, and IP 44 for RPH 40-20 and RPH 50-25. The motors feature low build-up current.

ELECTRICAL EQUIPMENT

Single-phase motors are equipped with a starting capacitor which is mounted on the fan casing. The wiring is terminated in a terminal box of IP 40 protection degree under covering panel. For wiring diagrams, refer to the section "The Wiring".

MOTOR PROTECTION

As standard, permanent monitoring of the internal motor temperature is used in all motors. The limit temperature is monitored by thermal contacts (TK-thermo-contacts) situated in the motor winding. The thermo-contacts are miniature thermal tripping elements which after being connected to the protective contactor circuit protect the motor against overheating (damage) due to phase failure, forced motor braking, current protection circuit breakdown or excessive temperature of transported air. Thermal protection by means of thermo-contacts is comprehensive and reliable providing they are correctly connected. This type of protection is essential especially for speed controlled and frequently started motors and motors highly thermally loaded by hot transported air.

Therefore, the fan motors cannot be protected by conventional thermal protection ensured by the motor overcurrent protective elements!

Maximum thermo-contact permanent loading is 1.2 A at 250V / 50 Hz ($\cos \phi 0,6$) je 1,2 A (resp. 2 A respectively $\cos \phi 1,0$).

FAN OUTPUT CONTROL

The output of all RPH fans can be fully controlled by changing the speed. The fan's speed is changed depending on the voltage at the motor terminals. The fan parameter tables contain voltage controllers corresponding to each fan. Generally, several types of control can be used with fans. However, voltage control is the most suitable for RPH fans.

Five Stage Voltage Control (transformer type)

Voltage control of single-phase and three-phase RPH fans is the most suitable, technically as well as operationally. There is no interference, humming, squeaking or vibration of the motor.

TABLE 1
THE INPUT VOLTAGE AND CONTROLLER'S STAGE

| MOTOR TYPE | CURVE CHARACTERISTICS - CONTROLLER'S STAGE | | | | |
|------------|--|-------|-------|-------|-------|
| | 5 | 4 | 3 | 2 | 1 |
| 1 – phase | 230 V | 180 V | 160 V | 130 V | 105 V |
| 3 – phase | 400 V | 280 V | 230 V | 180 V | 140 V |

RPH fans can be steplessly controlled providing the change in voltage is stepless. In practice, stage voltage controllers are usually used. TRN stage voltage controllers can control the fan output in five stages in 20% steps, refer to Table # 1 showing the correlation between the input voltage and selected stage of the controller for single-phase and three-phase motors. RPH fan motors can be operated within a range of approx. from 25 % to 110 % of the rated voltage. All values respect the 400/230 V power supply system. The range of TRN controllers is intended to control the speed, respectively output, of all Vento fans. The possibility of remote control (by manual switch or by a switch in the control unit, respectively by automatic switching of five stages based on the external control signal of 0–10 V from the OSX control unit) is a significant feature of this product line. This product line includes three single-phase and four three-phase TRN controllers. These controllers cover every type of Vento fan. Simplified TRR controllers can also be used; however, they do not provide protection function.

Stepless Electronic Control

Stepless electronic voltage control of the output is offered only with single-phase fans. The disadvantage of electronic control provided by PE 2,5 and PE 4 controllers is greater warming of motors. A partial disadvantage is also the fact that the designer does not have the possibility to exactly define for the user the stage of required output related to the load of the ventilated space.

Stepless control can be provided by means of frequency inverters, which must be fitted with a sine wave filters at the the output side. Appropriate inverter with sinusoidal filter can be supplied according to customer requirements.

ACCESSORIES

RPH fans belong in the wide range of Vento modular venting and air-handling system components. Any air-handling set-up, from simple venting to sophisticated comfortable air-conditioning, can be created by selecting suitable elements. Universal duct RPH fans can be used along with a wide range of elements and accessories:

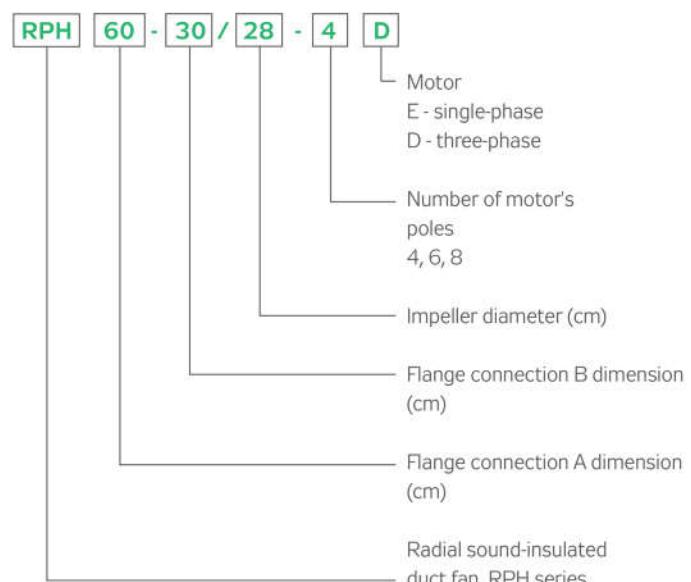

- KFD Bag Filters and KF3, KF5, KF7 Filter Inserts
- VFK Insert Air Filters and VF3 Filter Inserts
- VFT metal grease filters and spare VT3 cells
- DV Elastic Connections
- LKR, LKS, LKSX, and LKSF Regulating and Closing Dampers
- PK Pressure Dampers
- PZ Louvers
- TKU Splitter Attenuators
- VO Water Heaters
- SUMX Mixing Sets
- EO, EOS, EOSX Electric Heaters
- CHF Direct Coolers
- CHV Water Coolers
- HRV Plate Heat Exchangers
- SKX Circulating Air Mixing Chambers
- VLH humidification chambers and steam humidifiers
- Control units and sensors
- TRN Controllers, ORe 5 controllers, TRRE, TRRD Controllers, or PE controllers
- STE, STD Protecting Relays

FAN DESCRIPTION AND DESIGNATION

The key for type designation of RPH fans in projects and orders is defined in figure # 2.

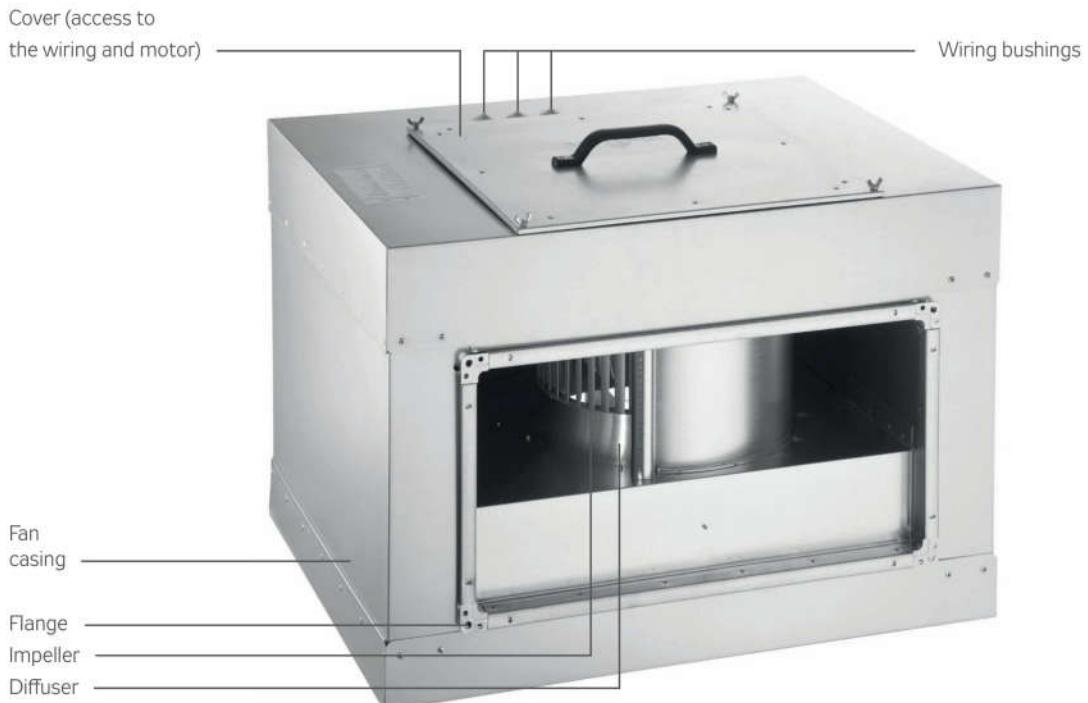

For example, type designation RPH 60-30/28-4D specifies the type of fan, impeller and motor.

FIGURE 2 – TYPE DESIGNATION OF RPH FANS

The most used names of the fan's individual parts and structure assemblies are shown on figure # 3.

FIGURE 3 – RPH FAN DESCRIPTION

DIMENSIONS, WEIGHTS AND PERFORMANCE

For important dimensions of RPH fans, refer to Figure #4 and Table #3. For basic parametrs refer to table #4.

SYMBOLS USED IN TABLE 4:

| | | | |
|--------------|---|------------|---|
| V_{\max} | maximum air flow rate | t_{\max} | maximum permissible transported air temperature at air flow V_{\max} . |
| n | fan speed measured at the highest efficiency working point (5b), rounded to tens | C | capacitor capacity with single-phase fans |
| U | nominal power supply voltage of the motor without control (all values in the table are to this voltage) | FM. | frequency inverter |
| P_{\max} , | electric motor maximal power output | m | weight of the fan ($\pm 10\%$) |
| I_{\max} , | maximum phase current at voltage U (this value must be checked) | ErP2015 | Fan compliance with the requirements of Regulation 2009/125/EC (NOT compliant fans must not be used within EU region) |

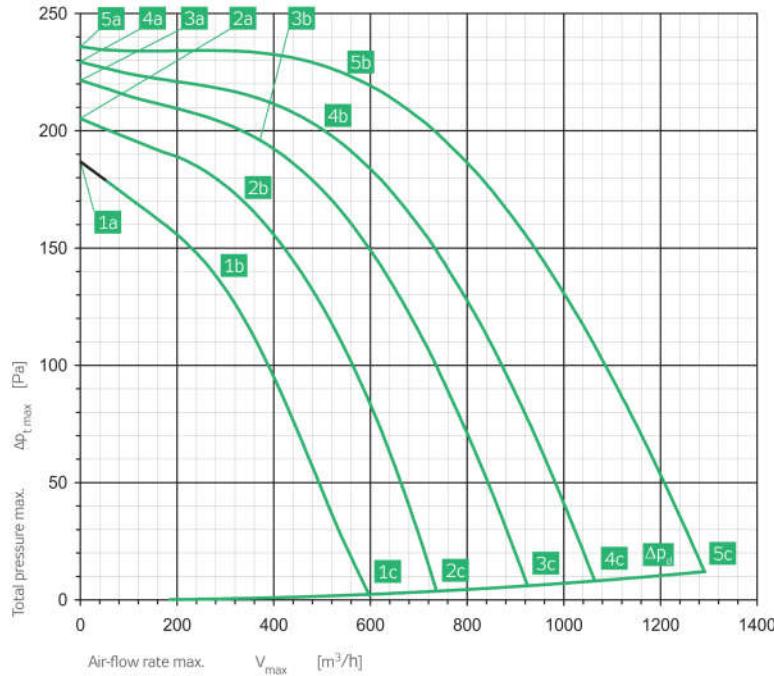

DATA SECTION

Graph 1 enables quick selection of a suitable fan and alternate comparison of RPH fans. Only the highest characteristics of each fan at nominal supply voltage, i.e. without a controller or with a controller set to five stage, are included in this graph.

The Data Section of the catalogue contains all important information and measured data of RPH fans.

INSTALLATION

- RPH fans (including other Vento elements and equipment) are not intended, due to their concept, for direct sale to end customers. Each installation must be performed in accordance with a professional project created by a qualified air-handling designer who is responsible for the proper selection of fan. The installation and commissioning may be performed only by an authorized company licensed in accordance with generally valid regulations.
 - It is recommended to insert the DV elastic connections in front of and behind the fan.
 - It is advisable to always place the KFD or VFK air filters, respectively VFT metal grease filter in front of the fan to protect the fan and duct against dirtying and dust fouling.
 - The fan must always be mounted on a separate hinges to avoid dampers or connected piping to be burdened. Trailers must be noise-isolated noise and vibration-proof (elastic shock absorber).
 - RPH fans can work only in a horizontal position. When placed under the ceiling is useful (for better access to the terminal block and the motor) to mount fan motor facing cup downwards.
 - In cramped areas, it is advisable to consider the necessity to situate directly behind the fan's outlet the duct adapting piece, attenuator, heat exchanger, heater, etc.
 - The construction and arrangement of the fan outlet is similar to the RP fan. It is obvious that from the entire cross-section (e.g. 500 x 250) only 1/4 of the outlet cross-section is free. This means that the airflow velocities close behind the fan can be as much as four times higher than, for example, in the inlet. Therefore, the greater the distance of attenuators (or other resistant elements) from the outlet, the better¹⁾.
- On the inlet side, the DV elastic connection will be sufficient as a distance piece in most cases.

WIRING

- The wiring can be performed only by a qualified worker licensed in accordance with national regulations.
- Terminal box located under opening panel with handle is fixed with screws to the fan casing is equipped with WAGO terminals; max. cross-section of connecting conductors 1.5 mm².
- The fans are equipped with thermo-contacts situated in the motor winding; they are connected to the TK terminals. If the motor is overloaded, the thermo-contact will open. To evaluate the failure, the thermo-contact must be connected to the control or regulating system (e.g. control unit, TRN controller or STE(D) relay) which is able to evaluate the failure, and protect the motor against unwanted thermal effects.
- For fan wiring diagram refer to figure 5.

FIGURE 5 – WIRING DIAGRAM

The wiring diagrams with front-end elements (protective relays, controllers, control units) are included in the installation manual, respectively in the AeroCAD project.

¹⁾ That recommendation applies to all duct fans.

EXAMPLE A**RPH FAN WITHOUT OUTPUT CONTROL
AND WITH STE(D) PROTECTING RELAY**

The RPH fan connection in a simple venting system without output control is shown in figure # 6.

This connection ensures:

- Full thermal protection of the fan using thermo-contacts and protecting relay, STE (single-phase) or STD (three-phase).
- Manual switching of the fan on/off using buttons on the STE(D) protecting relay.

After pressing the button marked "I" on the STE(D) protecting relay, the fan starts and the button will stay in the depressed position, signalling the fan's operation. The fan can be stopped by pressing the button marked "O".

If the motor winding is overheated above 130 °C due to overloading, the thermo-contacts in the motor winding will open. Upon the thermo-contacts opening, which are interconnected with the fan terminal box, the STE(D) protecting relay circuit TK, TK will be disconnected. As a reaction to this state, the STE(D) protecting relay will disconnect the power supply to the overheated motor. After cooling down, the motor is not automatically restarted. The failure must be confirmed (unblocked) by the operator by pressing the black "I" button.

EXAMPLE B**RPH FAN WITH OUTPUT CONTROL
AND TRN CONTROLLER**

The RPH fan connection in a venting system with output control using TRN controller with ORe5 controller is shown in figure # 7.

This connection ensures:

- The possibility of fan output selection within the stage range 1–5 as well as full protection via thermo-contacts.
- Fan switching on/off manually, by the ORe5 remote controller or any other switch (like room thermostat, gas detector, pressostat, hygrostat, etc).

Upon selecting the required output stage using a selector on the ORe 5 controller the fan will start at corresponding speed. The closed switch connected to PT1, PT2 terminals and the thermo-contact circuit connected to TK,TK terminals are essential for the fan operation. The switch connected to PT1, PT2 terminals can externally stop the fan. If this option is not used, it will be necessary to interconnect terminals PT1 and PT2. If the fan is overloaded, the thermo-contact circuit will be disconnected due to overheating of the motor winding. As a reaction to this state, the controller will disconnect the fan power supply, and the red control light on the ORe controller will signal the failure. After cooling down, the motor is not automatically restarted. To restart the fan, it is necessary first to set the selector to the "STOP" position, and thus confirm failure removal, and then to set the required fan output. In this arrangement, the option "STOP" on Ore 5 must not be blocked.

FIGURE 6 – FAN CONNECTION

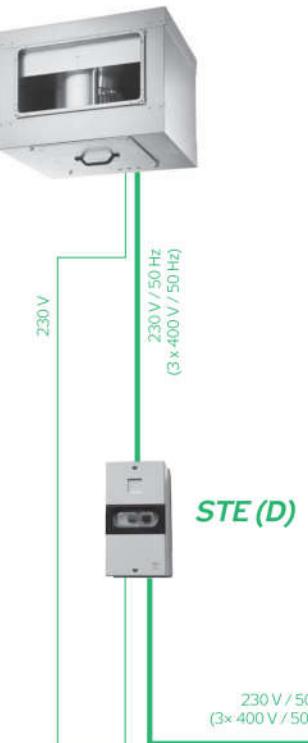

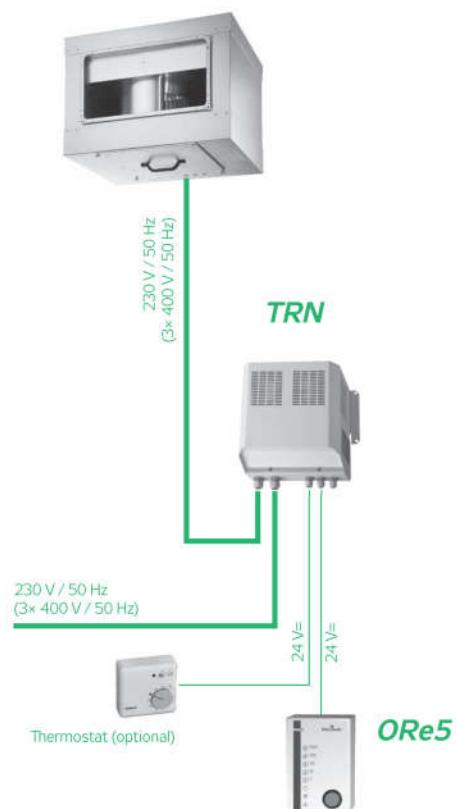

FIGURE 7 – FAN CONNECTION

EXAMPLE C**RPH FAN WITH TRN CONTROLLER
AND CONTROL UNIT**

The RPH fan with TRN output controller and a common internal controller in more sophisticated venting systems using the control unit is shown in figure # 8. The internal control is installed in the control unit during production.

This connection ensures:

- Fan switching on/off by the control unit. The motor protection must always be ensured by the control unit while TK,TK thermo-contact terminals are connected to 5a, 5a, 5b, 5b terminals in the control unit.
- Fan output control within the stage range 1-5 manually via HMI controller or using time schedule function of the control unit.

In the connection with control unit, all additional functions of the controller must always be blocked by interconnecting the PT2 and E48 terminals in the TRN-D controller..

The air-handling system is started by the control unit. All protecting and safety functions of fans as well as the entire system are ensured by the control unit.
